Solar Security develops software products and services to ensure information security of any business.

The software vendor HQ based in Moscow, Russia. It's been developing cutting-edge technologies based on vast expertise gained from 15 years' experience in the information security field. Solar Security Team strives to make the new technologies more accessible to information security specialists and managers. The deployment options vary from on-premises or SaaS to various models of managed services.

The portfolio of key products consists of:

1. **Solar Dozor** – a comprehensive Data Loss Prevention solution to monitor employees' digital communications at the workplace. It consists of powerful core module that provides various analytics on the data and several submodules to monitor traffic, user behavior analytics, correspondence, employee's internal and external communications and much more. The key purpose is to avoid financial losses and data leakage.
2. **Solar Appscreener** – a next-generation software for static code review aimed to protect any application for your business. The software supports source code analysis for more than 22 programming languages and for some binaries files. Applications from Google Play or AppStore can be scanned just by the web links from the stores. The tool provides detailed results on vulnerabilities with recommendations on how to fix them even if you do not have a technical background.
3. **Solar JSOC** (Security Operation Center) services. JSOC team knows well how to investigate information security incidents in a 24/7 mode. They key portfolio of the services include: incident monitoring, web application security as a service, cybercrime prevention, application security testing, vulnerability management and security systems maintenance.

Number of employees – 200+
